Size-selected by column fractionation; average insert size 1.08 kb. Library was amplified once on solid support and plasmid DNA from library was prepared. The library DNA was normalized by method #4 from Honaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded library plasmid DNA was mixed with 5 micrograms PCR product representing library inserts and hybridized to an Ecot of 20. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this

The invention provides complete or partial genomic sequences of the MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by these genes. The invention also provides antibodies raised against the polypeptides. The genomic sequences, polypeptides and antibodies are also claimed useful for diagnosing infection by MS and rheumatoid arthritis-associated viruses, and also for prevention and treatment of infection with these viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure;

The present sequence represents the nucleotide sequence corresponding to the 3' env region and long terminal repeat sequences from clone CL6 of Multiple Sclerosis retrovirus (NSRV-1). The specification describes a long terminal repeat (LTR)-RU5 region which encodes the expression of a MSRV-1 protein. This is unusual for LTRs, in particular in the RU5 region. The sequence includes CAAT and TATA
                                                                                                                                                                                                                                                                        CAAT_signal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a multiple sclerosis (MS) associated retrovirus (MSRV) genomic fragment used in the method of the invention. The invention provides complete or partial genomic sequences of the MSRV-1 pol gene, gag gene and env gene, and polypeptides encoded by these genes. The invention also provides antibodies raised against the polypeptides. The genomic sequences, polypeptides and antibodies are also claimed useful for diagnosing infection by MS and rheumatoid arthritis-associated viruses, and also for prevention and treatment of infection with these viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CDS

polynucleotides isolated from human secreted proteins encoded by CC blood or adult placenta, or murine adult testes, adult brain, adult CC libraries. The products of the invention are predicted to have biological activities which would make them suitable for treating, preventing or CC supporting data is given. Suggested activities include nutritional CC activity, cytokine and cell proliferation/differentiation activity, cytokine succines) or suppressing activity, cytokine and cell proliferation/differentiation activity, CC immune stimulating (e.g. as vaccines) or suppressing activity, haemostatic activity inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, chemotactic/chemokinetic activity, and tumour CC activity, cadherin/tumour invasion suppressor activity, and tumour CC inhibition activity. The polynucleotides are also stated to be useful to

                                                                                                                                                                                                                                                                                                                                                                                                   treating, preventing or ameliorating medical conditions in humans and animals. Detection of the levels of the proteins can be used for the diagnosis of e.g. pre-eclampsia, placental pathology or cancer. Agents which modulate the expression or function of the proteins may be used for treating a neoplastic disease and inhibiting metastasis. Other suggested activities include nutritional activity (e.g. in feeds), cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activin/inhibin activity, chemokinetic activity, haematoratic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cablerin/tumour invasion suppressor activity, and tumour inhibition activity. The polynucleotide sequences are also stated to be useful for gene therapy.
                                                                                            2323
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the human secreted protein AJ172_2 nucleotide sequence, obtained from a human adult testes cDNA library. The invention relates to secreted human and murine proteins. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; secreted protein; disease diagnosis; pre-eclampsia; cancer placental pathology; metastasis inhibition; nutritional activity; immune stimulator; haematopoiesis regulator; tissue growth; tumour inhibitor; anti-inflammatory; clone AJI72_2; ATCC_98115;

The specification describes a method for detecting expression of an envelope protein from a human endogenous retrovirus (HERV), in cells, of a tissue or culture. The method comprises detecting syncytia formation due to the fusogenic properties of the envelope protein. Envelope polypeptides and polynucleotides are used to produce therapeutic or prophylactic compositions, particularly for treatment of cancer, to correct defects in placental development (or other natural formation of other types of syncytia), and to promote adhesion of cells in grafts or cellular repair processes. Expression of sequences antisense to the polynucleotide are used to prevent formation of
                                                                                                          2625

The nucleic acids, their fragments or peptides by them are markers of autoimmune disease (e.g. multiple sclerosi rheumatoid polyarthritis, disseminated lupus crythematosus, insul dependent diabetes and related pathologies) and of abnormal or unsuccessful pregnancy and can be used as chromosomal markers for susceptibility to these conditions, or proximity markers of genes associated with this susceptibility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    multiple sclerosis; rheumatoid polyarthritis; insulin-dependent disseminated lupus erythematosus; pregnancy; chromosomal marker;
